

**ALWAYS “FIXED FORMULA”  
FOR CONSISTENT  
QUALITY, PERFORMANCE AND SAFETY**

**FEED AND CARE RECOMMENDATIONS:  
YOUNG GROWING HORSE  
UNDER 3 YEARS**

There are three periods in a horse’s life when nutrition is most critical. These periods are late pregnancy, weaning to three years old and old age. The nutritional program during the first three years of a horse’s life can have a profound impact on the performance of a horse for the rest of its life. The most critical concept in feeding a young growing horse is to feed a balanced diet in which all ingredients are supplied in adequate amounts, but just as important, they are supplied in the correct amounts relative to each other.

King offers both a textured and a pelleted supplement that are properly balanced for the young developing horse.

**JUNIOR DELIGHT** is an extremely palatable supplement to alfalfa or mixed hay diets which allows the young equine to achieve optimum growth and structural soundness at maturity. This textured feed is high in digestible energy (1470 kcal/lb) and includes supplemental levels of lysine a critical amino acid which supports the latter stages of growth and development. Fortified with chelated minerals to support bone and cartilage growth and a pre-biotic to support digestive health, JUNIOR DELIGHT is presently being used by horse breeders desiring the development of the best racehorses possible.

**Equine 11% Pellet** is ideal for yearlings on a high protein roughage (alfalfa) diet. This lower protein pelleted feed includes supplemental levels of lysine a critical amino acid which supports the latter stages of growth and development. Fortified with chelated minerals to support bone and cartilage growth, pre- and probiotics for digestive health, an herbal extract blend for immune support, whole plant yucca (a natural antiinflammatory) for joint support – this comprehensive supplement ensures a balanced approach to the maturing young horse.
